

Press release February 21, 2014

Aluwave expands and quadruples the capacity of its LED module production

Two years ago, Aluwave AB started an in-house production of customized light sources based on LED technology. Now, the company has implemented yet another assembly line (SMT line) in the production to meet the increased demand on the market. Thanks to this, Aluwave will now quadruple its production capacity and increase flexibility and quality for the company's customers.

"It was a logical decision as we continue to expand according to plan and we foresee increased order volumes. Last year, we more than doubled our turn-over and we continue to recruit staff to keep a high service level. Now, we take yet another step towards our vision; to be best-in-class when it comes to design and production of LED modules", says Jonas Stålhandske, CEO at Aluwave. He continues;

"Thanks to the new SMT line, we will be able to offer our customers even better services in terms of lead time, flexibility and quality. In addition, with two parallel production lines, we will be less vulnerable for outages as we have redundant production processes".

The new SMT line was installed in late January and is now up and running in the production. The new line enables offline-preparations, automatic quality control and production of larger and more complex LED modules than before. The previous SMT line will be kept in operation, producing shorter series and prototypes.

The possibilities to customize and control the light source for unique lighting needs are great with LED technology. Thus, in many applications, traditional light sources are now being replaced by the latest technology which increases the demand for LED solutions. Several companies place specific demands on their light source, in terms of amount of light, color of light, physical dimensions, optics and control. This is why the demand for customized light sources continuously increase, a demand that Aluwave meets with its offering of design services and production.

About Aluwave:

Aluwave is a Swedish, fast-growing company that provides unique solutions to customers in the lighting industry and industries with specific demands on lighting. The company designs and produces customized light sources based on LED technology. The success of the company is a result of its background in cooling of electronics. We know the importance of thermal management and how it affects the lighting performance in terms of energy efficiency, luminous flux and lifetime. Aluwave provides solutions to the market of General lighting, Street lighting, Vehicle lighting and Technical lighting.

More about the SMT line:

The term, SMT-line, is often used when referring to an assembly line including surface mount technology. This type of line is producing electronic circuits in which the components are mounted or placed directly onto the surface of a printed circuit board (PCB).
